Diffraction deep inelastic scattering

Jan Cepila

based on publication in preparation with
D. Bendová, J.G. Contreras, V. P. Gonçalves, M. Matas

What is it good for..

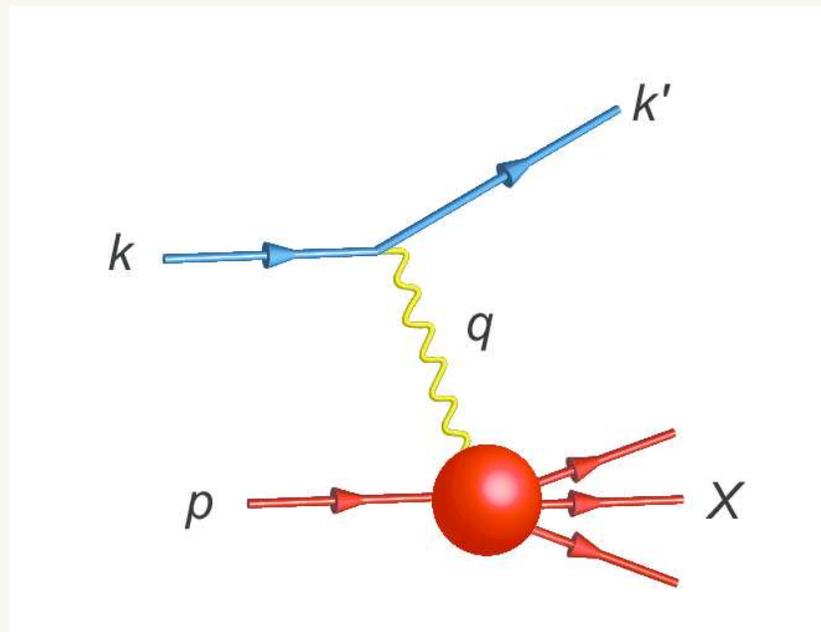

- **We want to study the gluon distribution inside a hadron**
- Towards larger scale Q^2 , the number of gluons rises linearly but their size gets smaller
- Towards smaller Bjorken x , the number of gluons rises linearly without changing the size
- When the dilute system gets to dense regime (CGC) by crossing saturation scale Q_s^2 , linear evolution no longer holds
- Non-linear regime is described by infinite hierarchy of coupled (JIMWLK) equations for correlators of Wilson lines (don't ask me what it is..)
- In mean field approximation and large N_c limit, the first equation decouples to single non-linear integro-differential equation for 2-point correlator - scattering amplitude of a dipole off the CGC matter.

What is diffractive deep inelastic scattering?

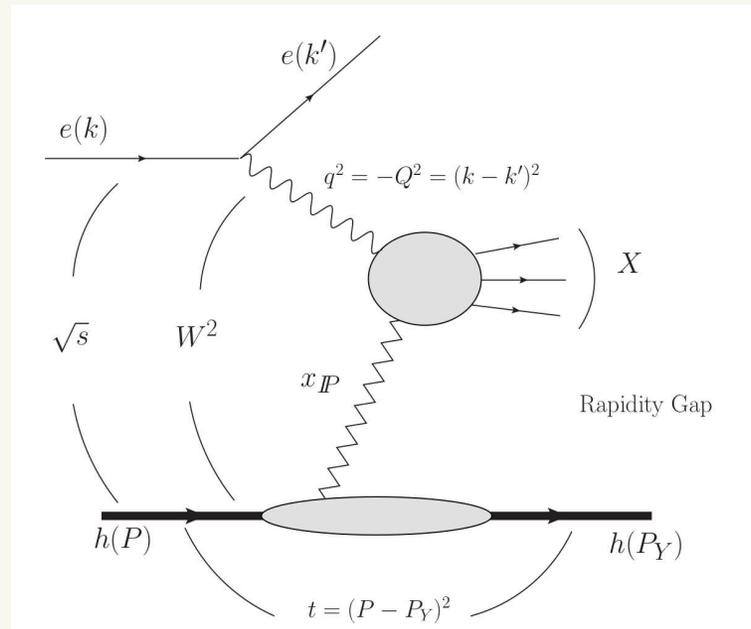

- "Normal" deep inelastic scattering - an electron scatters off the hadron leading to an electron + bunch of hadrons denoted X
- $W_{\gamma p}^2 = M_X^2$ is the center-of-mass energy of the photon-hadron system
- Bjorken- x is
$$x_{Bj} = \frac{Q^2}{W_{\gamma p}^2 + Q^2 - M_N^2}$$

M_N is the mass of the hadron, $Q^2 = -(k - k')^2$ is the scale of the incoming photon
- Low- x limit (saturation regime) manifests at large $W_{\gamma p}$

What is diffractive deep inelastic scattering?

- Diffractive deep inelastic scattering - an electron scatters off the hadron leading to an electron + hadron + bunch of hadrons denoted X
- $W_{\gamma p}^2$ is the center-of-mass energy of the photon-hadron system
- $x_{\mathbb{P}} = \frac{Q^2 + M_X^2}{W_{\gamma p}^2 + Q^2}$ is a fractional longitudinal momentum loss of a hadron
- One more degree of freedom - $\beta = \frac{Q^2}{M_X^2 + Q^2}$
- Bjorken- x is $x_{Bj} = \beta x_{\mathbb{P}} = \frac{Q^2}{W_{\gamma p}^2 + Q^2}$, $Q^2 = -(k - k')^2$ is the scale of the incoming photon

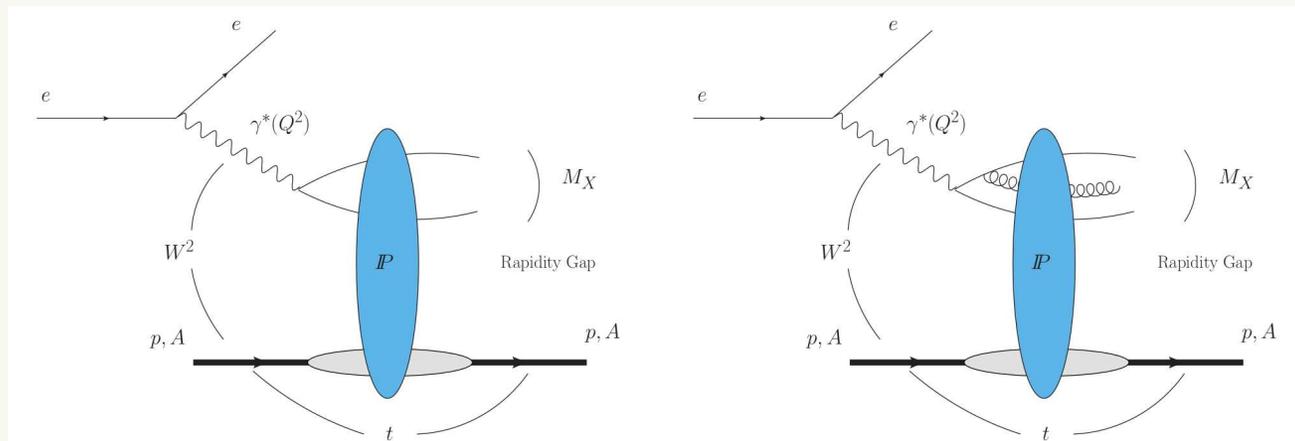

From the cross sections to the structure functions..

- Differential cross section for diffractive DIS

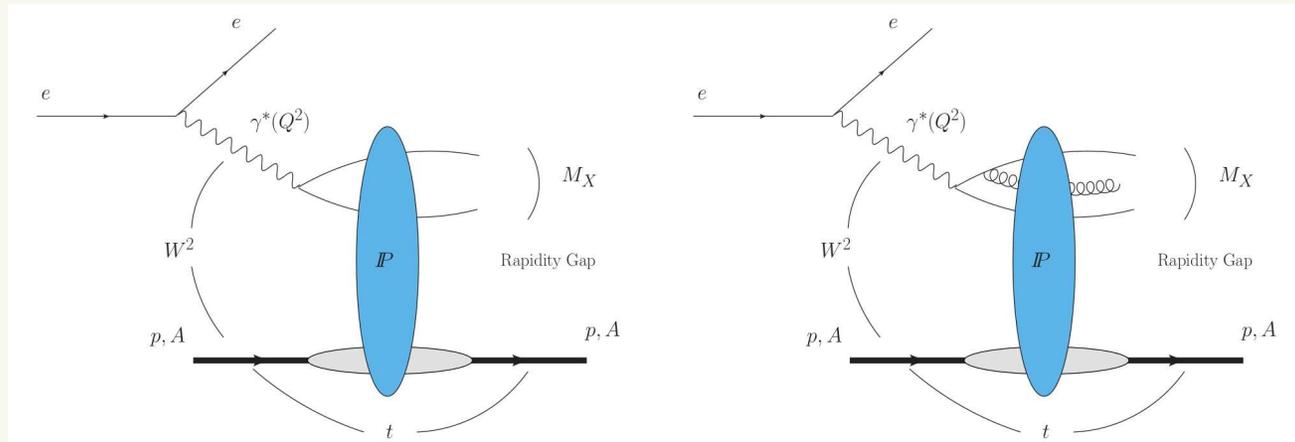

$$\frac{d\sigma^{eh \rightarrow eXh}}{d\beta dQ^2 dx_{\mathbb{P}}} = \frac{4\pi\alpha^2}{\beta Q^4} \left[1 - y + \frac{y^2}{2} \right] \left(F_2^{D(3)}(x_{\mathbb{P}}, \beta, Q^2) - \frac{y^2}{1 + (1-y)^2} F_L^{D(3)}(x_{\mathbb{P}}, \beta, Q^2) \right)$$

- y is the fractional energy loss of the electron in the hadron rest frame
- $F_2^{D(3)}$ and $F_L^{D(3)}$ are diffractive structure functions
- Experimentally, the process is recognized by the presence of a leading hadron and the rapidity gap of the width $\ln(1/x_{\mathbb{P}})$
- In the color dipole approach, we take a photon and expand it into the series of colorless parton states, that scatter elastically on the hadron

From the cross sections to the structure functions..

- We restrict ourselves to two simplest states $q\bar{q}$ and $q\bar{q}g$

$$F_2^{D(3)} = F_{T,q\bar{q}}^D + F_{L,q\bar{q}}^D + F_{T,q\bar{q}q}^D (+F_{L,q\bar{q}q}^D)$$

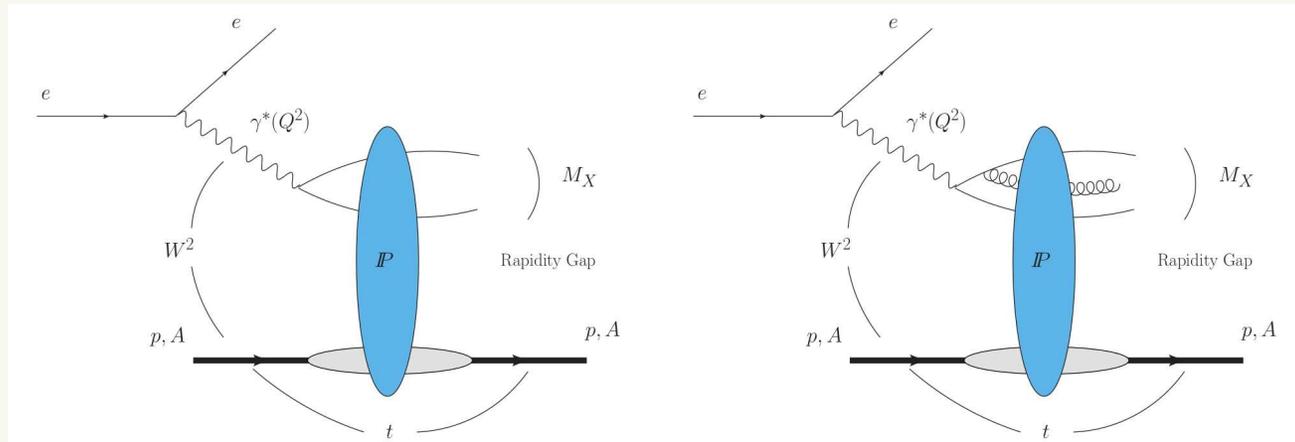

T, L denote the transverse and longitudinal degrees of freedom of the photon, last term has no leading log in Q^2

$$x_{\mathbb{P}} F_{T,q\bar{q}}^D(x_{\mathbb{P}}, \beta, Q^2) = \frac{N_c Q^4}{16\pi^3 \beta} \sum_f e_f^2 \int_{z_0}^{1/2} dz z(1-z) \left\{ \epsilon^2 [z^2 + (1-z)^2] \Phi_1 + m_f^2 \Phi_0 \right\}$$

$$\epsilon^2 = z(1-z)Q^2 + m_f^2 \quad z_0 = \frac{1}{2} \left(1 - \sqrt{1 - \frac{4m_f^2}{M_X^2}} \right)$$

From the cross sections to the structure functions..

- We restrict ourselves to two simplest states $q\bar{q}$ and $q\bar{q}g$

$$F_2^{D(3)} = F_{T,q\bar{q}}^D + F_{L,q\bar{q}}^D + F_{T,q\bar{q}q}^D (+F_{L,q\bar{q}q}^D)$$

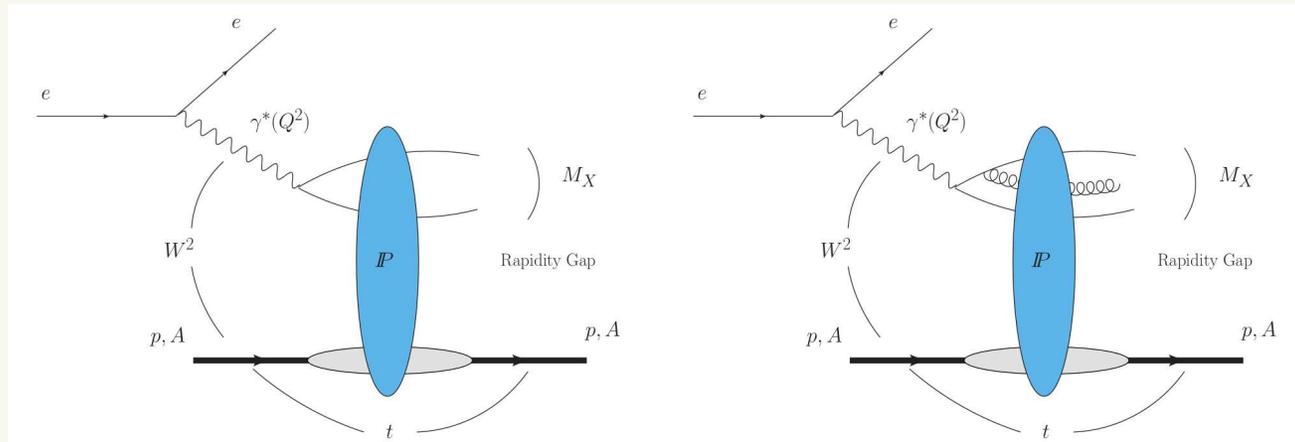

T, L denote the transverse and longitudinal degrees of freedom of the photon, last term has no leading log in Q^2

$$x_{\mathbb{P}} F_{L,q\bar{q}}^D(x_{\mathbb{P}}, \beta, Q^2) = \frac{N_c Q^6}{4\pi^3 \beta} \sum_f e_f^2 \int_{z_0}^{1/2} dz z^3 (1-z)^3 \Phi_0$$

$$\Phi_{0,1} = \int d^2 b_t \left[\int_0^\infty dr r K_{0,1}(\epsilon r) J_{0,1}(kr) \frac{d\sigma}{d^2 b_t}(b_t, r, x_{\mathbb{P}}) \right]^2 \quad k^2 = z(1-z)M_X^2 - m_f^2$$

From the cross sections to the structure functions..

- We restrict ourselves to two simplest states $q\bar{q}$ and $q\bar{q}g$

$$F_2^{D(3)} = F_{T,q\bar{q}}^D + F_{L,q\bar{q}}^D + F_{T,q\bar{q}g}^D (+F_{L,q\bar{q}g}^D)$$

T, L denote the transverse and longitudinal degrees of freedom of the photon, last term has no leading log in Q^2

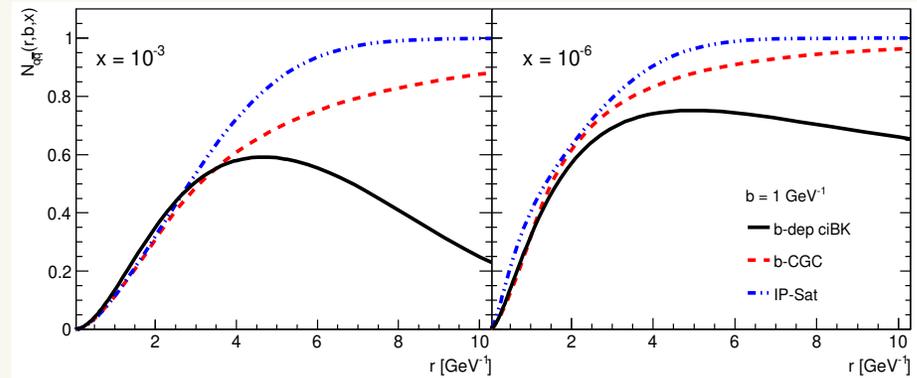

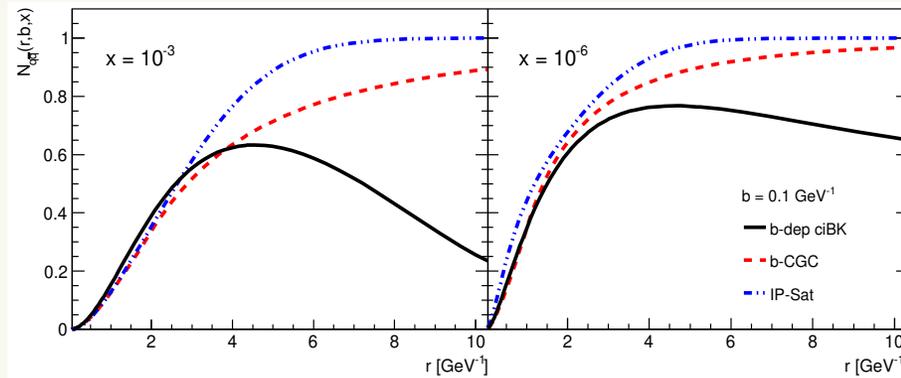

$$x_{\mathbb{P}} F_{T,q\bar{q}g}^D(x_{\mathbb{P}}, \beta, Q^2) = \frac{\alpha_s \beta}{8\pi^4} \sum_f e_f^2 \int d^2 b_t \int_0^{Q^2} d\kappa^2 \int_{\beta}^1 dz \left\{ \kappa^4 \ln \frac{Q^2}{\kappa^2} \left[\left(1 - \frac{\beta}{z}\right)^2 + \left(\frac{\beta}{z}\right)^2 \right] \right. \\ \left. \cdot \left[\int_0^{\infty} dr r \frac{d\sigma_g}{d^2 b_t} K_2(\sqrt{z}\kappa r) J_2(\sqrt{1-z}\kappa r) \right]^2 \right\} \quad \frac{d\sigma_g}{d^2 b_t} = 2 \left[1 - \left(1 - \frac{1}{2} \frac{d\sigma}{d^2 b_t} \right)^2 \right]$$

Dipole cross section

- From the optical theorem

$$\frac{d\sigma_{q\bar{q}}}{d^2b_t} = 2N(r, b_t, Y)$$

- IPSat model - CGC inspired phenomenological model, Gaussian profile of a proton
- b-CGC model - continuous connection of two limiting BK solutions, Gaussian profile of a proton
- impact parameter dependent solution of collinearly improved BK equation (talk by Marek)

Nuclear dipole cross section

- IPSat + Glauber-Gribov (GG) approach

$$N^A(r, b_t, Y) = 2 \left(1 - e^{-\frac{1}{2} \sigma_{q\bar{q}}(r, Y) T_A(b_t)} \right) \quad \sigma_{q\bar{q}}(r, Y) = 2 \int d^2 b_p N^{IPSat}(r, b_p, Y)$$

- b-CGC + Glauber-Gribov (GG) approach

$$N^A(r, b_t, Y) = 2 \left(1 - e^{-\frac{1}{2} \sigma_{q\bar{q}}(r, Y) T_A(b_t)} \right) \quad \sigma_{q\bar{q}}(r, Y) = 2 \int d^2 b_p N^{b-CGC}(r, b_p, Y)$$

- b-dep ciBK + Glauber-Gribov (GG) approach

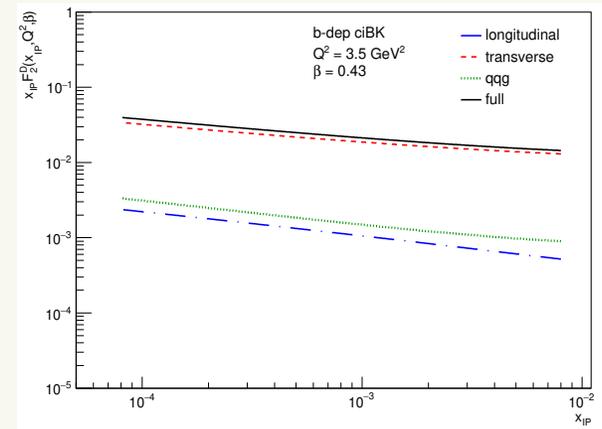

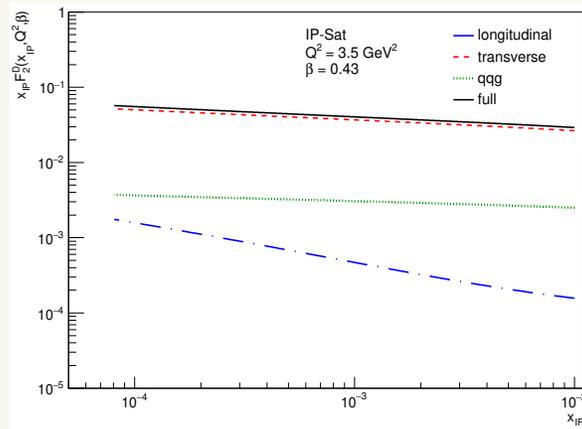

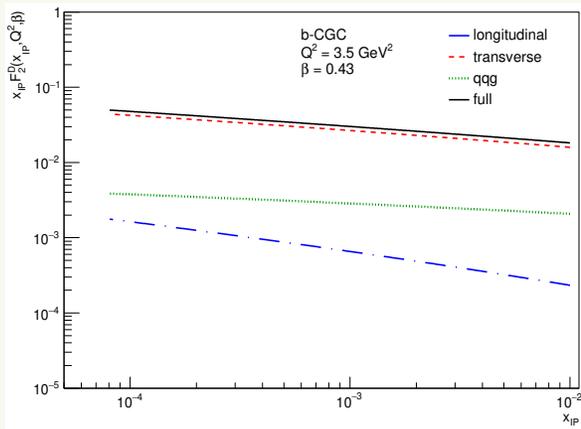

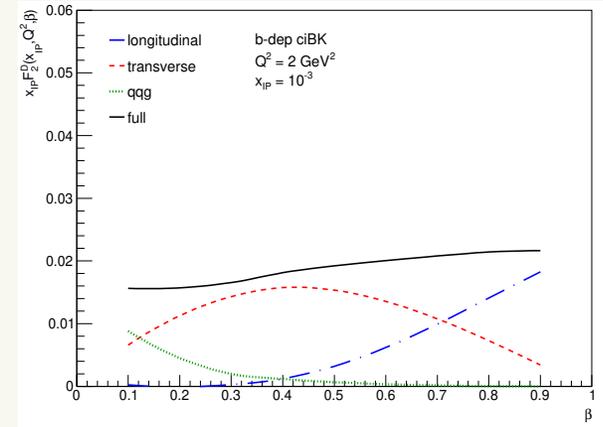

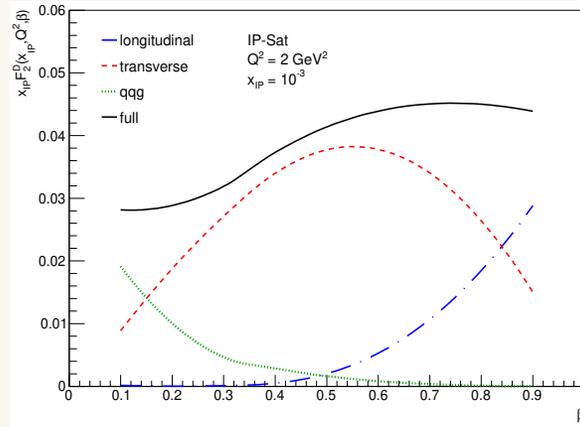

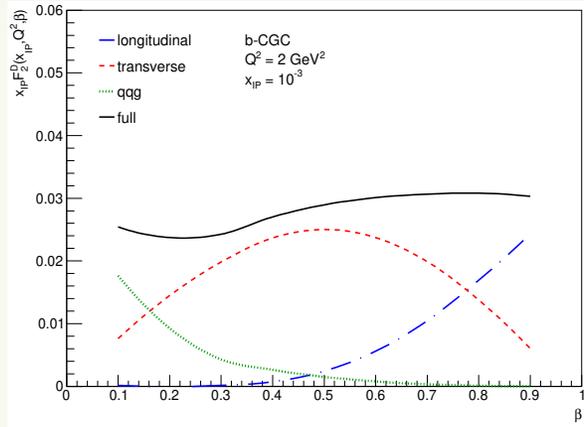

$$N^A(r, b_t, Y) = 2 \left(1 - e^{-\frac{1}{2} \sigma_{q\bar{q}}(r, Y) T_A(b_t)} \right) \quad \sigma_{q\bar{q}}(r, Y) = 2 \int d^2 b_p N^{bdepBK}(r, b_p, Y)$$

- b-dep ciBK evolved nucleus

$$N^A(r, b_t, Y = 0) = \left(1 - e^{-\frac{1}{2} \sigma_{q\bar{q}}(r, Y) T_A(b_t)} \right) \quad \sigma_{q\bar{q}}(r, Y) = \frac{r^2 Q_{SA}^2(Y)}{4}$$

- T_A is the nuclear profile function from Wood-Saxon distribution
