Variational U-ne

Twin experiment 0000 Conclusion

Source term estimation problem

- Data = amount of some substance (for example microplastics) at measuring stations (green stars in the figure)
- Task = estimate the source of the measured substance in space and time

Variational U-ne

Twin experiment

伺下 イヨト イヨト

Conclusion 0

Source term estimation problem

- **u** $\mathbf{y} \in \mathbb{R}^{N}_{+,0}$ is the measured amount of the substance,
- x_{lon,lat} ∈ ℝ^T_{+,0} is the hypothetical emission over T time periods at a given longitude and latitude,
- M_{lon,lat} ∈ ℝ^{N×T}_{+,0} is the source-receptor-sensitivity matrix for given longitude and latitude (provided by Nikolaos Evangeliou from NILU).

Then

$$\mathbf{y} = \sum_{\text{lon}} \sum_{\text{lat}} \mathbf{M}_{\text{lon,lat}} \mathbf{x}_{\text{lon,lat}}.$$

Bayesian neural networks

Variational U-net

win experiment 000

・ 同 ト ・ ヨ ト ・ ヨ ト

Conclusion 0

This problem is **severaly ill-posed**, especially when the number of measurements is low

\Rightarrow it is crucial to estimate the **uncertainty** of **x** as well.

Conclusion

Spatial Bayesian neural networks (SBNN)

The I-th hidden layer is given by

$$f_l(.; \mathbf{W}_l, \mathbf{b}_l) = \mathbf{W}_l tanh(.) + \mathbf{b}_l,$$

where

 $\mathbf{W}_{I} \sim \mathcal{N}(\mu_{I}^{W}, \sigma_{I}^{W}), \quad \text{and} \quad \mathbf{b}_{I} \sim \mathcal{N}(\mu_{I}^{b}, \sigma_{I}^{b}).$

・ 同 ト ・ ヨ ト ・ ヨ ト

Spatial embedding layer

- Embedding of 3D coordinates by radial function on grid denoted by ρ(lon, lat, t).
- Skip connections incorporate the spatial information directly into the estimation of the network parameters as

$$\begin{split} \mu_{I}^{W,b} &= \alpha_{I}^{W,b} \rho(\mathsf{lon},\mathsf{lat},\mathsf{t}), \\ \sigma_{I}^{W,b} &= \mathsf{softplus}\left(\beta_{I}^{W,b} \rho\left(\mathsf{lon},\mathsf{lat},\mathsf{t}\right)\right). \end{split}$$

Variational U-n

Twin experiment

Conclusion 0

Pretraining to spatial lognormal process

- According to Zammit-Mangion et al., 2024, the SBNN can be trained to mimic lognormal process by optimization of Wasserstein distance.
- It proved necessary in order to obtain a reasonable estimate in the inverse modelling.

Variational U-ne 000 win experiment

・ 同 ト ・ ヨ ト ・ ヨ ト

Conclusion 0

Inverse modelling

- x is obtained by sampling ⇒ sample mean is the estimate of x and sample standard deviation is the estimate of uncertainty.
- MSE loss between prediction and measurements.

Deep Image Prior

- Convolutional neural networks are a good prior for image reconstruction problems (Ulyanov et al., 2018).
- Similarly to correlation of neighbouring pixels in images, closer spatial locations in source term should also correlate.
- \Rightarrow **x** will be estimated by U-net.

Conclusion

Variational U-net

Hierarchical model

- \blacksquare Likelihood: $\boldsymbol{y}|\boldsymbol{x} \sim \mathcal{N}\left(\boldsymbol{M}\boldsymbol{x}, 10^{-5}\right)$
- Prior: $\mathbf{x} \sim \mathcal{N}(\boldsymbol{\mu}_0, \operatorname{diag}(\boldsymbol{\tau}^{-1})), \quad \text{where} \quad \boldsymbol{\tau} \sim \mathcal{G}(\alpha_0, \beta_0),$
- Posterior: $\mathbf{x}|\mathbf{y} \sim \mathcal{N}\left(\boldsymbol{\mu}, \operatorname{diag}(\mathbf{S}^2)\right)$ and $\boldsymbol{\tau}|\mathbf{y} \sim \delta\left(\hat{\boldsymbol{\tau}}\right)$,

 \Rightarrow estimation of $\boldsymbol{\mu}, \boldsymbol{S}$ and $\boldsymbol{\tau}$ by minimization of evidence lower bound.

Conclusions

- SBNN strongly overestimates the deposition, especially in areas of low SRS, and underestimates its uncertainty.
- Variational U-net estimates the uncertainty better than the other two methods, with most error covered by standard deviation. It also reflects the SRS in its estimate, which makes it the most suitable model for the problem.
