

Preparation of protein single crystals for electron diffraction experiments

středa 4. září 2024 9:50 (25 minut)

The use of electron crystallography in structural biology is gradually increasing due to the properties of electrons such as strong interaction with matter. Procedures for the preparation of protein crystal samples for electron diffraction as well as the subsequent processing of diffraction data are gradually being standardized. This work deals with the optimization of crystallization conditions for growing micro-crystals.
