

Measurements of $t\bar{t}$ differential cross-sections in the all-hadronic channel

Friday, 19 January 2018 16:45 (30 minutes)

Currently large $t\bar{t}$ production at the LHC allows detail study of the top quark, $t\bar{t}$ quark pairs. The talk will introduce the results of the analysis interested with the measurement of differential cross-section of high boosted t quark and $t\bar{t}$ pairs as a function of various kinematic observables. Study is performed on the full datasets collected by the ATLAS detector at $\sqrt{s} = 13$ TeV and pp collisions in 2015 and 2016. The integrated luminosity of considered datasets reached up 36.1 fb^{-1} . The studied spectra were corrected for detector effects and devolved to particle and parton fiducial phase space. The comparison is done with several type of theoretical predictions primarily with Powheg+Pythia8 Monte-Carlo generator. Such study provides a unique opportunity to test of Standard Model at the TeV scale.
